

Development

By using the best tools available, BPO's engineers provide you with detailed and reliable answers to the most complicated questions.

BPO uses tree leading High End CAD applications: Pro/Engineer, SolidWorks and Catia. This software supports the design and engineering process from the first ideas on to the most sophisticated production details.

Using special interfacing tools, we can continuously and efficiently integrate structural- and moldflow simulations in the design process. This speeds up the design process and increases the accuracy of the results.

Furthermore BPO uses eDrawings. With this program BPO can communicate design choices and features all along the different development stages.

Our CAD tools are not only aimed for quality, but also for optimal interfacing. We are able to communicate with all common CAD platforms.
